Re: Class II fluids, Grayling and Monopod platforms, Cook Inlet, Alaska

Dear Mr. Martin:

The commission has reviewed your request to augment waterflood injection on the Grayling and Monopod platforms with treated sanitary wastewater and glycol. Based on the chemical analysis provided, the commission acknowledges that treated sanitary waste water on both platforms is similar to the current EOR injection fluid. Accordingly, the commission concurs that the treated wastewater is appropriate to augment the current EOR fluid.

On the other hand, no data was submitted to support the glycol/water mixture as an appropriate EOR injection fluid. Therefore, the commission cannot conclude one way or the other its suitability for recovering hydrocarbons.

Should you have further questions regarding this matter please do not hesitate to contact us.

Sincerely,

David W. Johnston
Chairman
